S22 Commercial & Industrial Regulator Product Bulletin

1 PRODUCT OVERVIEW

The S22 regulator is a direct acting, balanced inlet pressure reducing regulator. The S22 is a spring-open design that is commonly used on commercial & industrial meter sets as well as smaller station applications. The S22 is available with a Valve Safety Integrated (VSI-22), an integrally mounted slam shut valve (SSV) which can provide Over Pressure Shut Off (OPSO) and/or Under Pressure Shut Off (UPSO). The VSI-22 is a completely independent device, providing the system with over pressure protection without any external devices needed.

The S22 features a dual lever arm design, which allows the actuator to be mounted directly above the internal valve components. This offers top entry accessibility for quick maintenance. The balanced inlet provides stable delivery pressure as inlet pressure changes, and allows the use of a single 1-3/8" orifice for all inlet pressures. This simplifies product sizing & selection and reduces inventory.

2 MATERIALS OF CONSTRUCTION

Mesura S22 Regulator

BODY:	Ductile Iron
DIAPHRAGMS CASING:	Aluminum
DIAPHRAGMS:	Nitrile (NBR)
SPRINGS:	Stainless steel
LEVER ARM & PINS:	SST, Steel & Zamak
ACTUATOR COUPLER:	Plastic
STEM/PLUG ASSEMBLY:	Stainless steel
PRESSURE SENSING:	External
FITTINGS:	Steel
ORIFICE:	Brass
DISCS AND O-RINGS:	Nitrile (NBR)
DIAPHRAGM PLATES:	Steel
CLOSING CAP:	Zinc Plated Steel
FASTENERS:	Zinc Plated Steel
ADJUSTING SCREW/BOLT:	Brass / Steel

Mesura VSI-22 Slam Shut Valve

MOUNTING FLANGE:	Brass Alloy
SSV SUPPORT:	Aluminum Bar Stock
COVER:	Aluminum
SPRINGS:	Stainless steel
STEM:	Stainless steel
ADJUSTING SCREW:	Brass
BALL BEARING:	Stainless steel
FITTINGS:	Steel
DISCS AND O-RINGS:	Nitrile (NBR)
DIAPHRAGM:	Nitrile/Reinforced NBR
DIAPHRAGM PLATES:	Steel
CLOSING CAP:	Brass
FASTENERS:	Steel
PRESSURE SENSING:	External

3 BASICS OF OPERATION

The Mesura S22 is a spring to open, direct operated regulator. Outlet pressure registers on the bottom of the diaphragm, which is opposed by the regulating spring. Set point is determined by the adjustment of the regulating spring. When outlet pressure drops below the set point, the regulating spring will force the diaphragm assembly down. This downward force is translated to the lever arm assembly, where the top beam transfers the force to the outer edge of the 2 lever arms. These lever arms pivot, using the downward force from the beam to lift the stem and plug away from the orifice, increasing the flow of gas to the downstream system.

As outlet pressure increases, the diaphragm will overcome the spring force and begin to move up and compress the regulating spring. This will pull the beam up, pulling up on the outer edge of the lever arms. As the lever arms pivot, the upward force from the beam will push the stem and the plug down until the plug presses into the orifice, stopping the flow of gas to the downstream system.

The VSI-22 slam shut valve operates independently from the S22 and can feature an OPSO or an UPSO. To activate the OPSO, downstream pressure must overcome the OPSO spring set point and move the diaphragm down (away from the orifice) until the stem releases and the shutoff spring forces the disk into the orifice. To activate the UPSO, downstream pressure must drop below the UPSO set point until the UPSO spring can force the VSI-22 diaphragm up (toward the orifice) until the stem releases and the shutoff spring forces the disk into the orifice.

4 SPECIFICATIONS

Table 1: S22 Regulator Specifications

Operating Inlet Pressure	BP/MP/AP	87 psig	6 bar	Emergency Inlet Pressure	290 psig	20 bar
	APA	290 psig	20 bar	Emergency Outlet Pressure (Casing)	87 psig	6 bar
Operating Outlet Pressure Range		See Table 11		Operating Temperature	-20 to 60 °C -4 to 140 °F	
Maximum Outlet Pressure to avoid damage to internal parts	BP	5 psig	345 mbar	Body Sizes	NPS 2	
	MP	11 psig	760 mbar	Flange Ratings	CL125 FF or CL150 RF	
	AP/APA	87 psig	6 bar	Vent Connection	1/2" NPT	
Maximum Differential Pressure	BP/MP/AP	87 psid	6 bar	Sense Line Connection	1/2" NPT	
	APA	285 psid	19.7 bar	Dimensions & Weight	See Section 11	
Orifice Size		1-3/8"		Wide Open Cg	810	

BP: Base Pressure, MP: Medium Pressure, AP: Apex Pressure, APA: Apex Piston Assembly

Table 2: VSI-S22 SSV Specifications

Emergency Inlet Pressure (Body)	290 psig	20 bar	Over Pressure Shut Off Accuracy	BP: AG 10 MP & APTR: AG 5
Emergency Outlet Pressure (Casing)	87 psig	6 bar	Under Pressure Shut Off Accuracy	BP: AG 20 MP: AG 10 APTR: AG 5
Dimensions & Weight	See Section 11			
Vent Connection	1/8" NPT		Sense Line Connection	1/8" NPT

5 AVAILABLE SAFETY FEATURES

OVERPRESSURE SHUT-OFF (OPSO)

If outlet pressure reaches the OPSO set point, the flow of gas is shut off at the inlet of the regulator. This requires a manual reset. OPSO is available standalone or with UPSO.

UNDERPRESSURE SHUT-OFF (UPSO)

If outlet pressure decreases to the UPSO set point, the flow of gas is shut off at the inlet of the regulator. This requires a manual reset.

MONITOR CONSTRUCTION

For monitor applications, an additional channel is added to the balancing system to improve reaction time of the monitor regulator. This provides a faster take-over of the monitor to minimize outlet pressure surges.

INTERNAL DAMPER

For constructions without IRV, the IRV spring is used to function as a damper to absorb surges in outlet pressure. This improves regulator stability, especially in the presence of small, quick changes in outlet pressure.

TOKEN INTERNAL RELIEF VALVE (IRV)

The internal relief valve will release a small amount of gas through the vent during an overpressure event. When the pressure decreases, the IRV re-seats, stopping the release of gas. This protects the regulator from brief pressure surges, such as thermal expansion.

6 OPERATIONAL SCHEMATICS

Figure 1: Mesura S22 BP & MP Schematic

The S22 regulator has 2 different actuators and 2 different balancing systems available that create the Base Pressure (BP), Medium Pressure (MP), Apex Pressure (AP), and Apex Piston Assembly (APA) constructions.

ACTUATOR & LEVER SYSTEM: The BP and MP constructions represented in Figure 1 use the standard actuator and lever system but have several different components designed for the respective outlet pressure ranges. The AP and APA constructions use a higher pressure actuator and lever system with a diaphragm limiter to allow for higher outlet pressures. The AP/APA actuator can be seen in Figure 3.

BALANCING SYSTEM: The balancing system utilized in the body determines the operating inlet pressure. The BP, MP and AP constructions utilize a balancing system that features a balancing diaphragm for improved performance at lower inlet pressures. This balancing system also has a monitor version available to improve monitor take over speed. These balancing systems can be seen in Figure 2. The APA version features the Apex Piston Assembly, which allows for inlet pressures up to 290 psig. The Apex Piston Assembly can be seen in Figure 3.

Figure 2: Alternative Trim Configurations

Figure 3: Mesura S22 APA Schematic

The VSI-22 is available as an OPSO only device or an OPSO/UPS0 device. The VSI-22 operates completely independently from the S22, only sharing the S22 body. During normal operation, the VSI-22 has no impact on the regulator. Once the OPSO or UPSO set point is reached and the VSI-22 activates and gas is stopped at the regulator inlet. The VSI-22 requires a manual reset.

Figure 4: VSI-22 OPSO Only

Figure 5: VSI-22 OPSO/UPS0

7 CAPACITY TABLES

Additional capacity information is available upon request.

Capacity data in Tables 3-9 was collected in accordance with EN334. As such, most of the information is displayed as AC5, AC10 or AC20. AC is the Accuracy Class associated with the flow rate. AC5 reflects +/- 5% from the set point of the regulator in gauge pressure. AC10 = +/- 10% and AC20 = +/- 20%.

10 PRODUCT MARKING & IDENTIFICATION

The sample nameplate below in Figure 6 shows the information available on each regulator. These are fixed to the S22 actuator on the spring barrel. The most critical components of an S22 regulator construction can be easily identified by a four or 5 digit code following “Type S22-” in the upper left hand corner of the nameplate. The series of numbers and letters after the dash correlate to Table 14. Table 14 indicates the set point, body style, and safety options of the S22.

		 cavagna group MANUFACTURER		Via Matteotti, 5 25012 CALVISANO (BS) MADE IN ITALY			
Type S22-##L-\$		Serial No: XXXXXX		DOM: MM/YY		EN 334	
Set Point:		XXXX PSIG		Spring Range:		XXX - XXX XXX	
Max Inlet Pressure:		XXXX PSIG		Orifice Size:		1-3/8 Inch	
IRV TYPE:		None		Max Operating Outlet:		XXXX PSIG	
				Emergency Casing:		XXXX PSIG	

Figure 6: S22 Regulator Nameplate

The S22 may feature a Valve Safety Integrated (VSI-22) into the same body. The VSI-22 is a slam shut valve (SSV) mounted in the same body of the S22, but operates completely independently from the regulator. This SSV will have its own name plate fixed to the diaphragm casing since it is an independent device. An example of this nameplate is below:
